

IN THE CLAIMS:

Please amend Claims 3 and 15-17, and add Claims 18-21 as follows.

1-2. (Canceled)

3. (Currently Amended) A digital camera ~~which~~ that can directly communicate with a printer, comprising:

a receiving unit that receives capability information of the printer from the printer, the capability information including first information and second information, the first information indicating whether the printer has a first function of automatically detecting a paper size, and the second information indicating whether the printer has a second function of automatically detecting a paper type;

a determination unit that (a) determines, ~~according to~~ based on the first information included in the received capability information received by the receiving unit, whether the printer has ~~[[a]]the first function of automatically detecting a paper size~~, and (b) determines, ~~according to~~ based on the second information included in the received capability information received by the receiving unit, whether the printer has ~~[[a]]the second function of automatically detecting a paper type~~; and

a user interface that notifies a user that the printer has the first function and the second functions if said function, after the determination unit determines that the printer has the first function and the second functions function.

4-14. (Canceled)

15. (Currently Amended) The digital camera according to claim 3, wherein ~~said~~ the user interface inhibits a user from selecting a paper size ~~if said~~ after the determination unit determines that the printer has the first function.

16. (Currently Amended) The digital camera according to claim 3, wherein ~~said~~ the user interface inhibits a user from selecting a paper type ~~if said~~ after the determination unit determines that the printer has the second function.

17. (Currently Amended) The digital camera according to claim 3, wherein ~~said~~ the user interface (a) inhibits a user from selecting a paper size ~~if said~~ after the determination unit determines that the printer has the first function and (b) inhibits a user from selecting a paper type, ~~if said~~ after the determination unit determines that the printer has the second function.

18. (New) A method of controlling a digital camera directly communicatable with a printer, comprising:

a receiving step of receiving capability information of the printer from the printer, the capability information including first information and second information, the first information indicating whether the printer has a first function of automatically detecting a paper size, and the second information indicating whether the printer has a second function of automatically detecting a paper type;

a first determining step of determining, based on the first information included in the capability information received in the receiving step, whether the printer has the first function;

a second determining step of determining, based on the second information included in the capability information received in the receiving step, whether the printer has the second function; and

a notifying step of notifying the user, by a user interface included in the digital camera, that the printer has the first function and the second function, after the first determining step determines that the printer has the first function and the second determining step determines that the printer has the second function.

19. (New) The method according to claim 18, further comprising:

an inhibiting step of inhibiting a user from selecting a paper size by the user interface, after the first determining step determines that the printer has the first function.

20. (New) The method according to claim 18, further comprising:

an inhibiting step of inhibiting a user from selecting a paper type by the user interface, after the second determining step determines that the printer has the second function.

21. (New) The method according to claim 18, further comprising:

a first inhibiting step of inhibiting a user from selecting a paper size by the user interface, after the first determining step determines that the printer has the first function; and

a second inhibiting step of inhibiting a user from selecting a paper type by the user interface, after the second determining step determines that the printer has the second function.
